

Spring Pond Care

Clean your pond: Manually scoop out sludge from the bottom of pond and then add Microbe Lift Sludge Away or Ecofix. If excessive, do a 1/3rd water exchange. Remember DeChlorinator when adding fresh water.

You will want to start adding bacteria to the pond to achieve the proper organic balance in your pond. Bacteria assist in breakdown of leaves, twigs, and other accumulated dead organic waste. Barley bales should be added to your pond at this time to prevent string algae.

When the water temperature is around 50 degrees you can start feeding your fish. Water temps are still on the cool side, so feed with a high-carbohydrate/ low protein fish food which is easily digested.
